

ABSTRACT OF THE DISCLOSURE

A shielding case can be easily removed for reworking. Insertion openings and cutouts individually continuing to the insertion openings are provided. To remove the shielding case fixed by soldering from a substrate, first, for example, edges of nippers are inserted into a pair of the insertion openings; then, the leg section is cut away by the nippers. The above cutting-away processing is sequentially performed for all the leg sections. Subsequently, a cover section is removed, solders fixing the individual leg sections are sequentially heated and melted one by one, and the leg sections are serially pulled out from the substrate. Thus, the shield case can be removed from the substrate.
